Summary

Cleaning and removing mold manually can be time-consuming, expensive, and unhealthy. If not done correctly, the removal process will make it worse. It can spread around the mold, rather than cleaning it.

When moldy materials are disturbed, they can release 10 to 1000 times more spores, which can be inhaled. Other methods may require walls be torn down and carpet removed to access the mold but does not guarantee that all of it will be found.

Opening moldy walls can release millions of spores. Moldy materials usually must be disposed of properly in plastic bags and replaced.

Man-made chemicals can be even more toxic than mold if not handled carefully. Chemical residue can remain after the it is gone. This process can take weeks to remove all of the mold.

Organic Remediation Products is safe and nontoxic; derived from a mixture of natural enzymes. It cleans and removes mold in hidden and hard-to-reach places without having to destroy property. It is safe and effective.
